

# Using the R Squared statistic

BAYESIAN REGRESSION MODELING WITH RSTANARM

Jake Thompson

Psychometrician, ATLAS, University of  
Kansas

# What is R squared?

- Coefficient of determination

$$R^2 = 1 - \frac{\sum_i (y_i - \hat{y}_i)^2}{\sum_i (y_i - \bar{y})^2}$$

# What is R squared?

- Coefficient of determination

$$R^2 = 1 - \frac{\sum_i (\text{Observed value } y_i - \text{Predicted value } \hat{y}_i)^2}{\sum_i (y_i - \bar{y})^2}$$

# What is R squared?

- Coefficient of determination

$$R^2 = 1 - \frac{\sum_i (y_i - \hat{y}_i)^2}{\sum_i (y_i - \bar{y})^2}$$

Observed value      Predicted value  
y<sub>i</sub>       $\hat{y}_i$   
Observed value      Mean value  
y<sub>i</sub>       $\bar{y}$

# Calculating R squared statistic

```

# The loo package

- LOO = leave-one-out
  - Approximated cross validation
  - `?loo-package`
  - Using `loo` for model comparisons

# Using loo on a single model

```
library(rstanarm)
library(loo)
stan_model <- stan_glm(kid_score ~ mom_iq, data = kidiq)
loo(stan_model)
```

Computed from 4000 by 434 log-likelihood matrix

	Estimate	SE
elpd_loo	-1878.5	14.5
p_loo	2.9	0.3
looic	3757.1	29.0
-----		

Monte Carlo SE of elpd\_loo is 0.0.

All Pareto k estimates are good ( $k < 0.5$ ).

See `help('pareto-k-diagnostic')` for details.

# Model comparisons with loo

```
