INTRODUCTION TO SPARK WITH SPARKLYR IN R

Richie Cotton

Data Evangelist at DataCamp

```
abba <- data_frame(  
  agnetha = 1:3,  
  benny = pi ^ c(1, 4, 9),  
  bjorn = month.name[1:3],  
  anni_frid = c(TRUE, FALSE, TRUE)  
)  
abba %>%  
  select(starts_with("a"))
```

```
# A tibble: 3 x 2  
agnetha anni_frid  
<int> <lgl>  
1     1 TRUE  
2     2 FALSE  
3     3 TRUE
```

Computing and collecting

```
intermediate_data <- initial_data %>%  
  # some calculations  
  compute("an_intermediate_result")
```

```
results <- intermediate_data %>%  
  # some more calculations  
  collect()
```

SQL and database joins

```
sql_query <- "SELECT agnetha, bjorn FROM abba where anni_frid"  
results <- dbGetQuery(spark_conn, sql_query)
```

```
agnetha    bjorn  
1          1 January  
2          3 March
```

Let's practice!
